DECLARATION

I've written this work report for my final project under the supervision of my **Project Supervisor Prof. Muhammad Bilal** at the Department of Computer Science, Government Graduate College, Gojra.

I now state that the project “**The Crown Bench Services-Online Home Services Web Application**”, and all of its content, with the exception of references, equations, formulas and the protocols are the result of my own study.

I additionally certify that no other degree or diploma has been sought to be awarded through the submission of this work. If the given information is later determined to be erroneous, the University may take appropriate action.

Signature of the Student:

Name: Aqib Ali

Registration No: 2018-GCUF-062747

DEDICATION

“In The Name of Allah, The Most Gracious, The Most Merciful”

This project is dedicated to our parents who have never failed to give us financial and moral support, for giving all our needs during the time we developed our system and for teaching us that even the largest task can be accomplished if it is done one step at a time.

This paper is dedicated to my institution mentor **Prof. Muhammad Bilal** under whose constant guidance I have completed this dissertation. They not only enlightened me with academic knowledge but also gave me valuable advice whenever I needed it the most.

We dedicate this Project to all the people who have worked hard to help us complete this project.

ACKNOWLEDGEMENTS

In successfully completing this project, many people have helped me. I would like to thank all those who are related to this project.

Primarily, I would thank ALLAH for being able to complete this project with success. Then I will thank **Mr. Muhammad Rafiq** (Principal of Government Post Graduate College, Gojra) and **Prof. Muhammad Bilal** (Head of Computer Science Department), under whose guidance I learned a lot about this project. His suggestions and directions have helped in the completion of this project.

Finally, I would like to thank my parents and friends who have helped me with their valuable suggestions and guidance and have been very helpful in various stages of project completion.

Signature of the Students:

Name: Aqib Ali

Registration No: 2018-GCUF-062747

CERTIFICATE BY SUPERVISORY COMMITTEE

We certify that the contents and form of thesis submitted by **Aqib Ali, Registration No: 2018-GCUF-062747** has been found satisfactory and in accordance with the prescribed format. We recommend it to be processed for the evaluation by the External Examiner for the award of degree.

Chapter No 1: Introduction to the Problem

1.1. Introduction:

THE CROWN BENCH SERVICES provides a unique and revolutionary service in the home maintenance offering Home Cleaning, Painter, home appliances, plumbing, carpenter services are involved in a system to provide happy and healthy home atmosphere in order to satisfy consumers. When someone need aid with small but major household tasks, the trouble arises when service skilled persons are unavailable or the trusted providers are impossible to find, who delivers systematically perfect service on instance. Our online system for household services provides the most expedient and annoys free way to get your domestic work done.

When someone need aid with small but major household tasks, the trouble arises when service skilled persons are unavailable or the trusted providers are impossible to find, who delivers consistently flawless service on instance. Our online system for household services provides the most expedient and annoys free way to get your domestic work done. We aim to help in providing optimal solutions to all your household troubles with more efficiency, ease and majorly, a delicate touch. A single click system describes booking highly skilled in-house professionals and gets your service done on time. Customers' overall willingness to pay is significantly and positively correlated with the expectation that fee-based services would be better, and with the belief that "pay for what you get" is the right thing to do. Keeping that in sense our proposed system is basically a marketplace for household services and it is the platform where the rates were standardized and there is no necessitate haggling over prices. Several aspects like painting, pest control, home cleaning, plumbing, electrical works and carpentry services are involved in a system to provide happy and healthy home atmosphere in order to satisfy consumers. Background:

System analysis is the process of understanding problems and user's requirements and proposing solutions to meet these needs. The goal of system analysis is to gain better understanding of a problem being solved earlier to the development phase. System analysis, sometime called requirement analysis is the process of gathering information about the current system, identifying its strengths and problems, and analyzing them to produce a concept for the new system. The goal of this analysis stage is to truly understand the requirements for the new system and develop a system concept that addresses them. This section of the documentation contains the functionality and use cases of system.

1.2. The purpose of the project

We are aimed to develop an Online home services website using the open-source technologies like (HTML5, CSS3 and JavaScript for Frontend, PHP as backend MySQL and Xampp Local Host server using technology of Apache for Backend). This website will have an Admin Panel and User view where the admin panel will be handled by administrator and user view will provide the login access to the users who are eligible to see services and he can request any of services any time.

The main purpose of this website is to develop a one roof platform for the effective interaction, effective exposure, and a right direction toward communication between service gainer and its service.

The aim is to provide our users an opportunity to enhance their experience by using online home services platform.

1.3. The scope of the project:

The scope of our project is to design a complete environment to provide a safe and user-friendly environment for online service booking. The main aim of the project is to provider an easy-to-use website for services provided for consumer.

The main purpose of the proposed system isto provide an online home services solution for service provider and service gainer. It will automatically perform some of the basic functions of an online service providing like calculating the total of services. Scope will be providing basic services using the web system to make that process automated. It will include providing admin access management. It will provide administrative functionality to manage services, service providers and service gainer.

The consumer will be able to browse and select for service under different services. Selected service or services selected for list will be added to the visible services cart. What can be managed separately by the consumer? It can be checked at any time by the consumer for selected service and price. These can be key tasks besides some common tasks like login, logout, and profile management.

1.4. Objective:

The primary objective of The Crown Bench Services is about delivering the home services at the doorstep just by one click. To provide an authenticated and authorized login module for the users such as service seekers and the admin, by providing appropriate credentials at the time of registration. To design an interactive User Interface for seeking services on the go. To provide a secured online payment gateway for service seekers. To acknowledge the conformation of services opted by the users.

The overall objective of this project is to establish a system for consumers to avail services online after getting all essential information related to the services from the website. We tried to make this system more convenient for users that they can get services online without any hassle in a secure way without going out of their home. We made the mechanism of handling clients and keeping their record online simple and secure. The following are specific objective for this project.

- Help for saving of time.
- To provide ease in ordering home service.
- Offering friendly 24/7 consumer service.
- Convenience and accessibility on-the-go, to home service needs.
- To Provide ease to improve security.

- Increasing urbanization is leading on the growth of global online on-demand home services, our purpose is to provide this facility.

1.5. Intended audience and reading suggestions:

The intended audience will be the users from different areas throughout the world. The main purpose to write this proposal is to provide the summarized review of our project. This proposal will enlighten the main introduction, purpose, objectives, present and future scope of this project. Basic software and hardware requirements of this project are also discussed in this proposal.

Reviewers/developers can read detailed descriptions of this project from the required sections. This proposal is intended to be approved. This proposal will be used as a reference to the development of this project for different developers and reviewers.

1.6. Document conventions:

- **Entire document should be justified.**
- **Document line spacing: 1.5**
- **Convention for Main title**
 - Font face: Times New Roman
 - Font style: Bold
 - Font Size: 14
- **Convention for Subtitle**
 - Font face: Times New Roman
 - Font style: Bold
 - Font Size: 12
- **Convention for body**
 - Font face: Times New Roman
 - Font Size: 12

HTML-Hypertext markup language

CSS-Cascading Style Sheets

PHP-Hypertext Preprocessor

OS-Operating System.

GUI-Graphical User Interface.

SQL-Structured Query Language.

Ajax-Asynchronous JavaScript and XML.

JS-JavaScript.

Bootstrap-Bootstrap Framework.

MYSQL-Database (MySQL).

Chapter No 2: Software Requirement Specification

2.1. OVERALL DISCRIPTION:

2.1.1. Product perspective:

The software product is a Web application. The application will be made up of two parts, one administrator who has all the rights and the other user who has limited rights to handle the application. The two users of the system, namely the Service Manager (Admin) and Customers (User) interact with the system in different ways. In the current scenario, people are immersed in a heavy work culture, because everyone is busy with busy schedules, and busy tasks that cause them to move away from family life. People do not have enough time to solve problems for themselves and their homes. Therefore, most people find it easy to get any service online. That's why online home services are becoming popular.

Now-a-days, online platforms have become the important of our life, therefore people who face difficulty in getting home services safely and conveniently, they will find many easy features under this platform. People will feel secure using this platform.

2.1.2. Product features:

First of all, it will authenticate the user whether he is Admin or User the unauthorized person can't get access to the application.

The admin will be able to Add, delete, and modify Services details. He can also Add, delete and modify Service Request made by Customers. He can use this application to check all reports related to assign work order as well as he can manipulate the data of Repair Request.

➤ Services Management:

Main services will be:

- Cleaning Service
- Plumbing Service
- Electrician Service
- Painter Service
- Home Appliances Repair

➤ Service Conformation

Firstly, Call will be dialed by admin after confirmation email will be send.

➤ Registration Management

Secure registration will be allowed by confirming email address.

➤ **Trust Module**

All information of service gainer will confidential.

➤ **Feedback/Review**

Consumers can give us rating and feedback about our service.

➤ **General Constraints:**

The application will run on windows XP, vista, window 7, and window 8 and higher the version of browsers below 7.1 is not supported.

2.1.3. Design and Implementation Constraints:

The major drawback is people are not much used to online home services using websites. Most of them don't trust online platforms and many of them are not familiar with websites usage etc. This project will resolve most of the errors or issues for the intended audience.

➤ **Operating Environment:**

This is a web-based application that works on web browsers (Like Chrome, Firebox and mobile devices). PHP was used to create this project and the MySQL server used to connect to the site so that the user could fetch data stored in the DB.

2.1.4. Assumptions and Dependencies:

- Admin has full access to the system.
- Admin and consumer must have valid id and password to log in.
- Admin can manage the whole system features.
- Admin can add or remove consumer and service providers.
- Users can only have access to their account service request and record.
- LAN or any other internet connection is required.

2.2. System Features:

A unique ID and password are assigned on the base of E-mail only for each Client and other users visit as a guest of this web application by administrator. So, every time they want to get access to system, he /she has to login.

2.3. EXTERNEl INTERFACE REQUIREMENTS:

These sections describe the functional requirements of the system.

2.3.1. User Interfaces

In this program there is a multi-page main interface connector, and the administrator can customize the interface according to their specific user requirements.

Administrator interaction has the following modules:

- **Manage consumer:** Admin has access to create, read, update and delete (CRUD) function and the user form contains user information fields and a list of privileges.
- **Services:** Displays a list of services.
- **Manage requests:** The administrator can process requests to use his or her service providing system.
- **Service providers:** The administrator can see the service providers list and can add and remove peoples from the list.

2.3.2. Hardware Interfaces

The timetable management system able to execute on computer and laptop with window operating system and other platform like Linux, UNIX. Hardware Interfaces.

Processor	: 2 GHz
Operating System	: Windows XP/Windows 7/Linux/Another Latest Version
RAM	: 2 MB
Hard disk	: 380 GB

2.3.3. Software Interfaces

The system will be running within the internet browser. The system must integrate with the database through SQL interface. The system will be hosted in web server running on window server.

- **Language Used:** PHP 5.1
- **Database:** My SQL
- **User Interface Design:** HTML, CSS, JavaScript, Bootstrap
- **Web Browser:** Google Chrome, Internet explorer

2.3.4. Login and Password:

A unique ID and password are assigned on the base of E-mail only for each teacher and other users visit as a guest of this web application by administrator. So, every time they want to get access to system, he /she has to login. System displays login page and after user has submitted it system matches ID and password. If match occurred user is allowed to access required pages else, he/she would be given an error message.

2.3.5. Admin requirements:

- Admin can login to system
- Admin can view his profile and can update profile
- Admin can manage new service provider (manually add, delete, view, update)
- Admin can manage new consumer (manually add, delete, view, update)
- Admin can manage consumer requests (manually add, delete, view, update)
- Admin can view work report and feedbacks of consumers
- Admin can print work report and print assigned work

2.3.6. Consumer Requirements:

- Consumer can register and login to system
- Consumer can view his profile and can update password
- Consumer can submit new/update/delete request
- Consumer can see his request status
- Consumer can give/view feedback

2.3.7. Administrators Detailed Attribute:

➤ Admin Login:

Admin needs to Sign in before entering the admin panel. After login he can get the whole control over the system.

➤ Admin Authority:

Admin can delete any user anytime if he feels any illegal activity. He can manage and modify the consumers, services and service providers.

➤ Admin Panel:

Admin will have full control over the admin panel/dashboard. Admin can manage each and everything through admin panel.

➤ Manage Consumer/Service providers:

The administrator has the authority to remove or add a consumer/service provider.

2.3.8. Consumer Detailed Attribute:

➤ Sign up:

This refers to registering as a consumer. A registered member has many system-related rights when a person becomes a consumer.

➤ **Sign In:**

Once a user is registered, the user becomes a consumer, and can access their personal information.

➤ **View:**

The consumer can see all the Booking service in the catalog and can view the Services and other features.

2.4. Non-functional Requirements:

2.4.1. Performance Requirements:

This system will work faster than the previous ones. As the many errors have been resolved. The retrieval of data from database will be faster. There will be less delays and requires less time to respond to user request. Data modification will be less time consuming and easy.

This system is designed according to the user requirements and user experience. Surely user will feel free and easy to user it.

2.4.2. Safety Requirements:

This system will be more secure than the other ones. Many securities related bugs have been puzzled out. Users will feel secure while entering his personal data. System will not cause any security contraventions. All the data will be saved to database for safety purpose so there will be no data loss. These data can be accessed only by an authorized person, so data theft is also not possible in this application.

2.4.3. Security Requirements:

Whenever user needs to access his account or admin need to access the system. The system will ask the login details. This is because of the security measurements. So that the system will be prevented from the unauthorized persons.

The data sent, stored and retrieved from the Database will be utterly secured. Users don't need to worry about the security. For preventing unauthorized access to the application, this application has login feature so only granted user can access with defined rights.

Chapter No 3: Analysis (Use Case Model)

3.1. Use Case Diagram entities:

3.1.1. Identifying Actors and Use Cases using Textual Analysis

A Use case in software engineering and in a project is a brief description of a system's behavior that talk about the response of a request originates from the outside of the website. A Use case describes “who” can do “what” on the website. The technique of use case is mostly used to capture and brief the website's behavior that will explain the detail of the requirements of the website through the functional requirements. A use case diagram is essentially a picture showing system behavior along with the key actors that interact with the system. The use case represents complete functionality.

Use case diagram can be imagined as a black box where only the input, output, and the function of the black box are known. Use Case elements are used to make test cases when performing the testing. The use case should contain all system activities that have significance to the users. A use case can be thought of as a collection of possible scenarios related to a particular goal, indeed. Use cases can be employed during several stages of software development, such as planning system requirements, validating design and testing software.

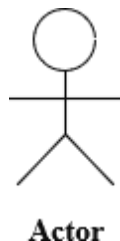

3.1.2. Use case Diagram Objects

Use case diagrams mostly consist of 3 objects:

➤ Actors

Actors are the persons who interact with the system. It is represented by a specific shape. Actor is a use case diagram is any entity that performs a role in one given system. This could be a person, organization or an external system. Actors identified by using textual analysis for The Crown Bench Services system are as follows.

1. Admin
2. User

➤ Use Cases

A Use case represents a function or an action within the system, its drawn as an oval and named with the function. They represent the use case view of a system. A use case represents a particular functionality of a system. So, use case diagram is used to describe the relationships among the functionalities and their internal/external controllers.

- | | |
|--------------------------------|---|
| 1. Login | 2. Register |
| 3. View Customer | 4. View/Update Profile |
| 5. New/Update Request | 6. View Request Status |
| 7. Add/Update Service Provider | 8. View/Print Work Report & Assign Work |
| 9. View Feedback | 10. Give/ View Feedback |

➤ System

System is used to define the scope of the use case and drawn as rectangle.

There are two functions:

Include: This represents required. Symbol of this function is dashed arrow and arrow is labeled with the keyword <<include>>

- - - - ->

Extend: This represents optional, and it is also shown with dashed arrow the arrow is labeled with the keyword <<extend>>

<- - - - -

3.2. Whole Use Case Diagram

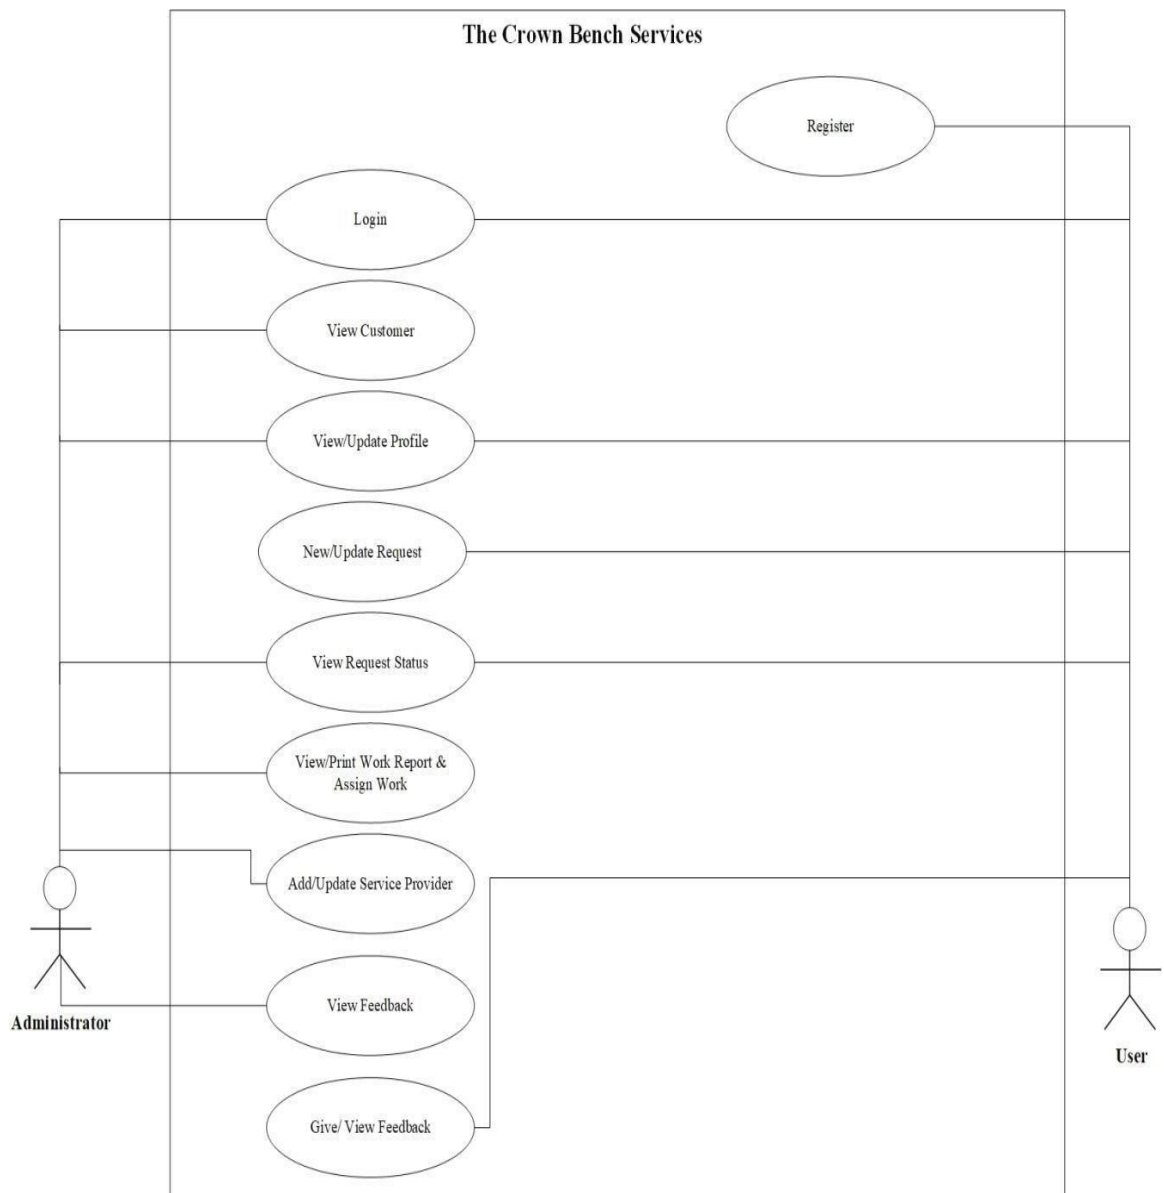

Figure (3.1): Whole use case diagram- The Crown Bench Services

3.2.1. Use-case diagram for Admin:

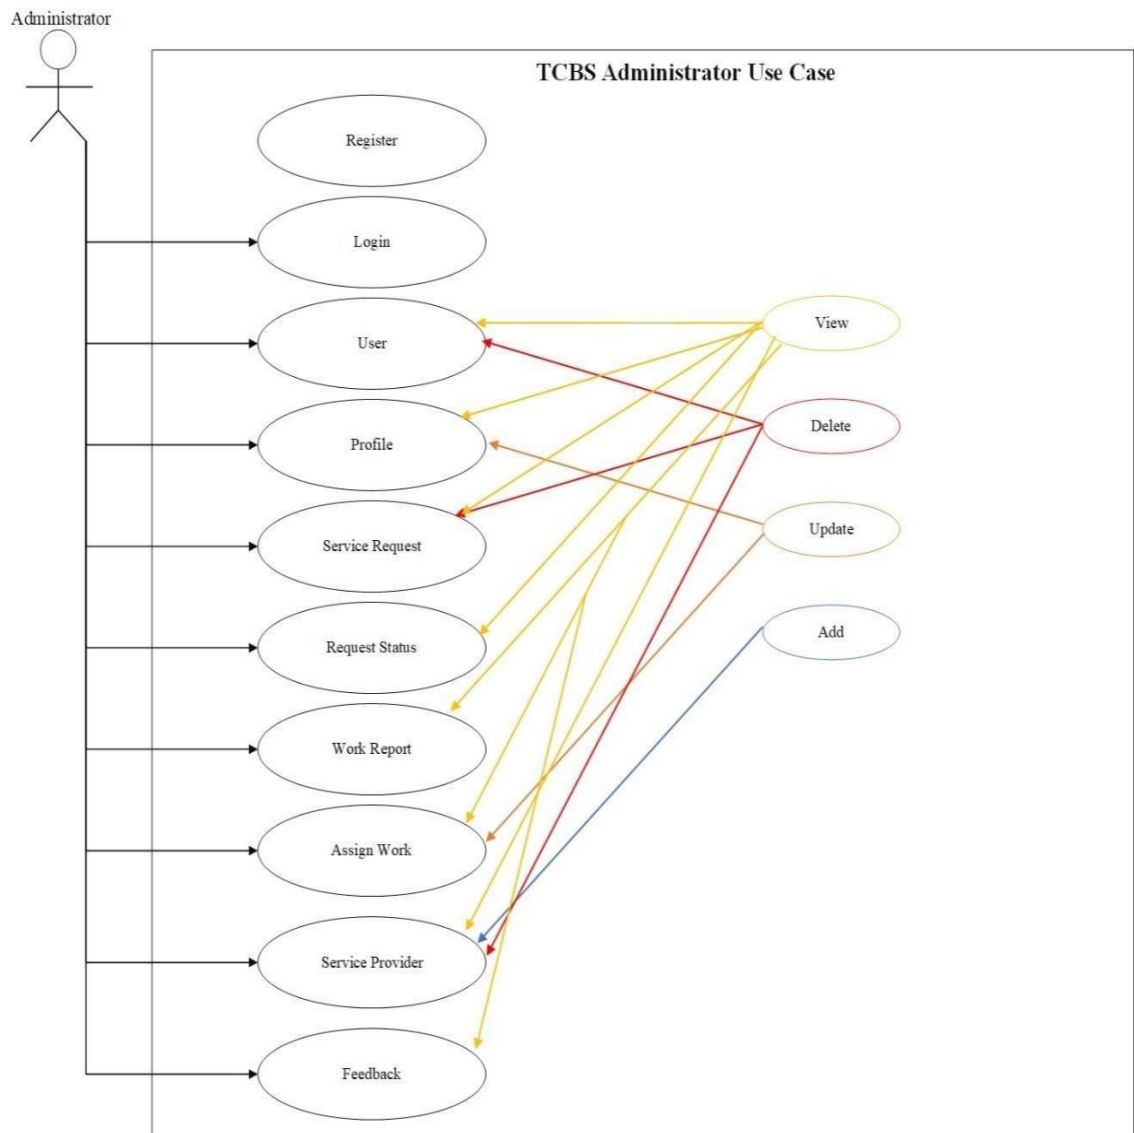

Figure (3.2): Admin use case diagram- The Crown Bench Services

3.2.2. USE-CASE Diagram for User/Consumer:

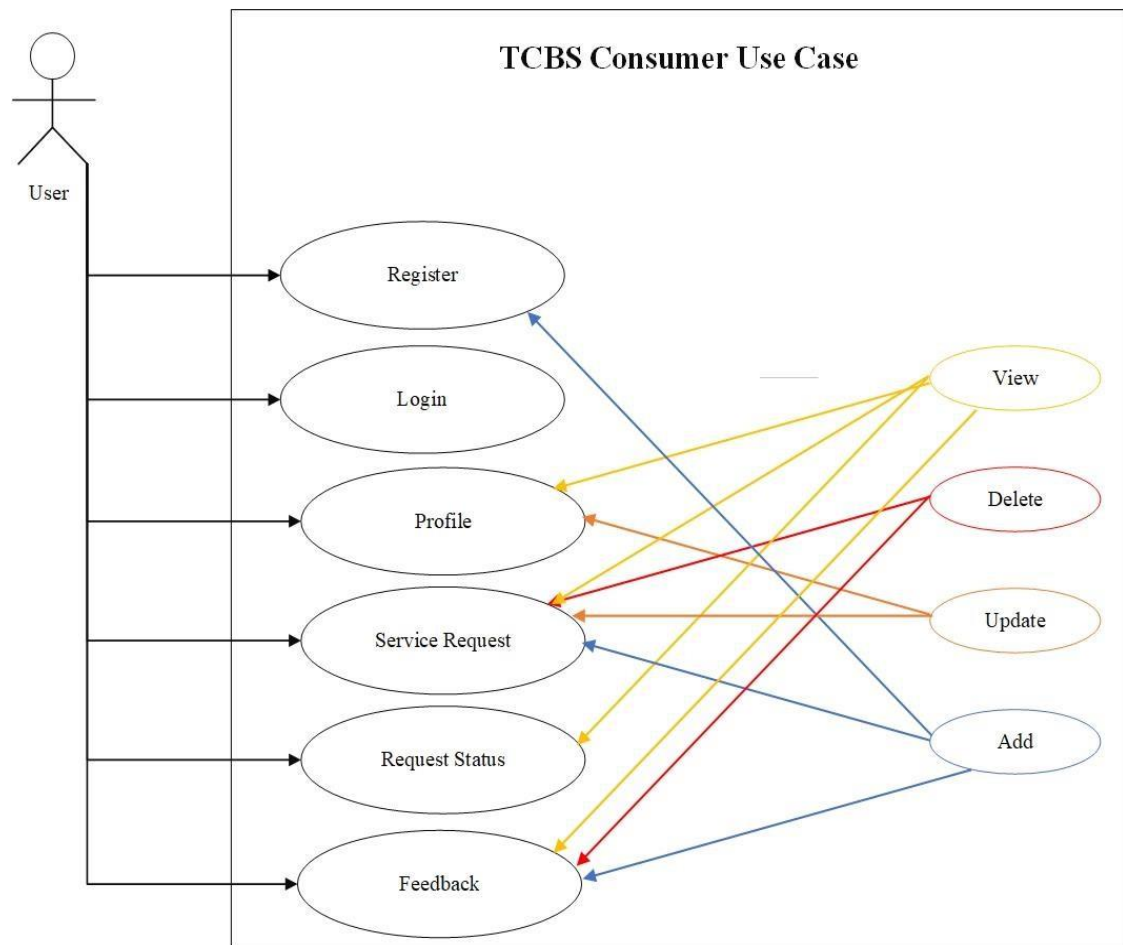

Figure (3.3): Consumer use case diagram- The Crown Bench Services

3.3. Extended Use Cases:

3.3.1. Use Case Login:

Use Case :1	
Name	Login
Actor	Admin, Consumer
Prerequisite	User must have a legitimate username and password.
Post-Status:	After entering their username and password their dashboard will be display on screen.
Exception:	The enter username and password will incorrect.

Alternatives:	User should re-enter correct username and password.
Solution:	Forgot option will be there.

Table (3.1): Use Case for Login

3.3.2. Use Case Signup:

Use Case :2	
Name	Signup
Actor	Consumer
Prerequisite	User must enter valid signup details.
Post-Status:	After entering details email will be verified.
Exception:	Email verification fail.
Alternatives:	User should re-enter his valid signup details.

Table (3.2): Use Case for Signup

3.3.3. Use Case Service request:

Use Case :3	
Name	Service request
Actor	Consumer
Prerequisite	User should login to system.
Post-Status:	User must confirm the service.
Exception:	User will not respond to Admin.
Alternatives:	User must have correct details.

Table (3.3): Use Case for Service request

3.3.4. Use Case Services:

Use Case :4	
Name	Services
Actor	Admin
Prerequisite	User must have access to admin module.

Post-Status:	Services form is display where admin can Perform CRUD operation and save changes.
Exception:	User has not permission to Services module.
Alternatives:	User must have correct details.

Table (3.4): Use Case for Services

3.3.5. Use Case Manage Requests:

Use Case :5	
Name	Manage Requests
Actor	Admin
Prerequisite	User must have access to admin module.
Post-Status:	Requests form is display where admin can Perform CRUD operation and save changes.
Exception:	User has not permission to Requests module.
Alternatives:	User must have correct details.

Table (3.5): Use Case for Manage Requests

3.3.6. Use Case Manage Consumer:

Use Case :6	
Name	Manage Consumer
Actor	Admin
Prerequisite	User must have access to the admin module.
Post-Status:	Consumer form is display where admin can Perform CRUD operation and save changes.
Exception:	If User has not permission to Consumer module.
Alternatives:	User must have correct details.

Table (3.6): Use Case Manage Consumer

Chapter No 4: Design

4.1. Architecture Diagram:

An architectural diagram is a diagram of a system that is used to describe the overall sketch of the software system and the relationships, constraints, and boundaries between components. It is an important diagram which is used describes the physical view of any system which helps the designer to design the system in a correct way.

The architecture diagram has three layers which are as follows.

- **Application layer:** This layer is used for data processing.
- **Data access layer:** This layer is used to store and manage data.
- **Business:** This layer is used to link application and data access layers.

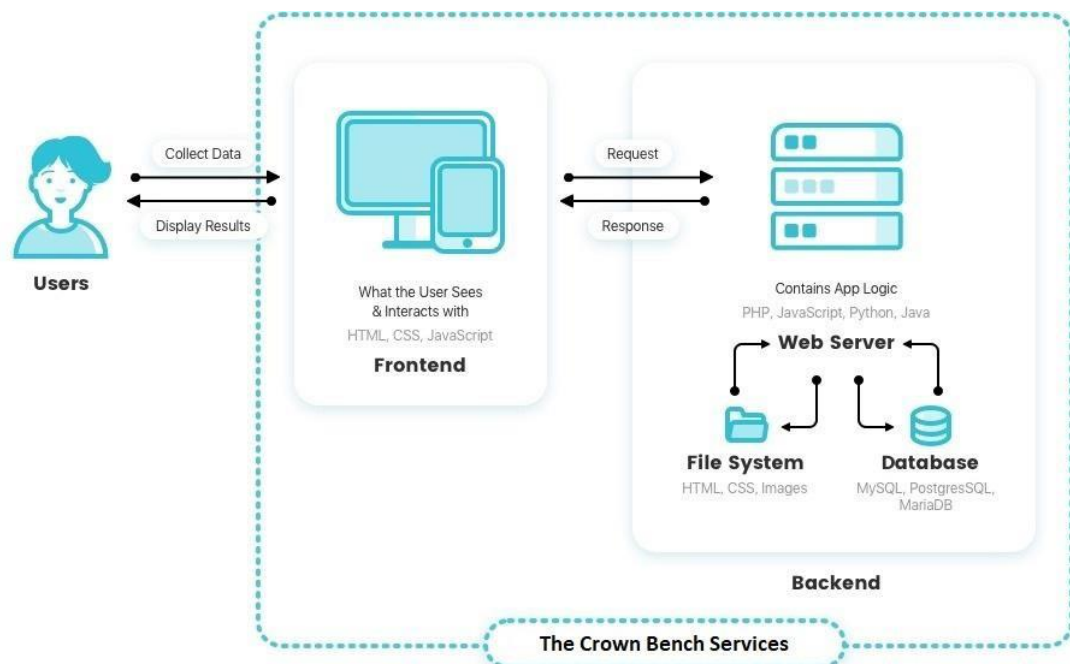

Figure (4.1): Architecture diagram- The Crown Bench Services

4.2. System Design:

Based on the user requirements and the detailed analysis of the system, the new system is to be designed. This is the phase of system designing. It is the most crucial phase in the developments of a system. The logical system design arrived at as a result of systems analysis is converted into physical system design. Systems design is the process of defining the architecture, components, modules, interfaces, and data for a system to satisfy specified requirements.

This section contains design overview of The Crown Bench Services web application. It contains the entity-relationships diagrams, schema, activity diagrams and system sequence diagrams of TCBS.

4.3. ERD (entity relationship diagram):

ERD (Entity relationship diagram) it is the graphical representation of any system which is used to depict the relationship among different people place and objects. Entity relationship diagram illustrate different entities and describe the relationship among those entities.

ER-modelling is a data modelling technique used in software engineering to produce a conceptual data model of an information system. Diagrams created using this ER-modelling technique are called Entity-Relationship Diagrams, or ER diagrams or ERDs. An entity-relationship diagram (ERD) is a data modelling technique that graphically illustrates an information system's entities and the relationships between those entities. An ERD is a conceptual and representational model of data used to represent the entity framework infrastructure.

The entity relationship diagram has three element which are as follows:

- Entities (Tables)
- Relationships (Table columns)
- Attributes (Relationships between tables)

➤ **Entity**

An entity is an object or component of data. An entity is represented as rectangle in an ER diagram. For example, In the following ER diagram we have five entities Employee, Admin, assign work, Requester and Submit request.

➤ Relationship

Relationship in the entity relationship diagram is used to create a link between different entities of system. The relationship is denoted by the diamond symbol. ERD relationship has three types of One-to-One, One-to- Many and Many-to Many. For example, In the following ER diagram different entities has different relationship such as admin and Requester has one-to-many relationship, Admin and Assign work has one-to-many relationship Requester and Submit Request has many-to-many relationship and so on.

➤ Attribute

Attributes, which are properties or characteristics of entities. An ERD attribute can be denoted as a primary key, which identifies a unique attribute, or a foreign key, which can be assigned to multiple attributes. The attribute is denoted by the oval sign. For example, in the following ERD diagram different entities has different attribute all the entities have a primary key attribute id which is uniquely identify for each entity.

Why create entity relational diagrams?

There can be several reasons, ranging from the ease and convenience of creating new database designs, to diagramming and documenting existing database structures. Of course, one of the main benefits is easier communication, as the relationships are usually more visible in an ER diagram and the database structure becomes clearer to understand.

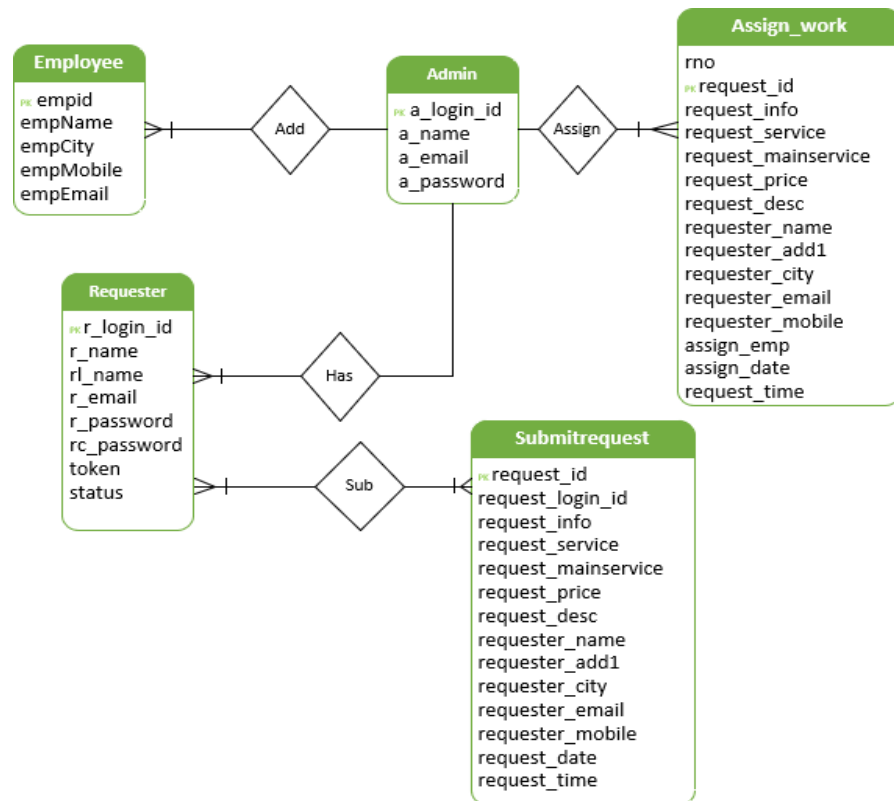

Figure 1.2: ER Diagram- The Crown bench services

4.4. Class Diagram:

Class Diagram provides an overview of the target system by describing the objects and classes inside the system and the relationships between them. It provides a wide variety of usages; from modeling the domain-specific data structure to detailed design of the target system. With the share model facilities, you can reuse your class model in the interaction diagram for modeling the detailed design of the dynamic behavior. The Form Diagram allows you to generate diagram automatically with user-defined scope. In the diagram, classes are represented with boxes which contain three parts.

The upper part holds the name of class.

The middle part contains the attributes of the class.

The bottom part gives the methods or operations of the class.

Class Diagram

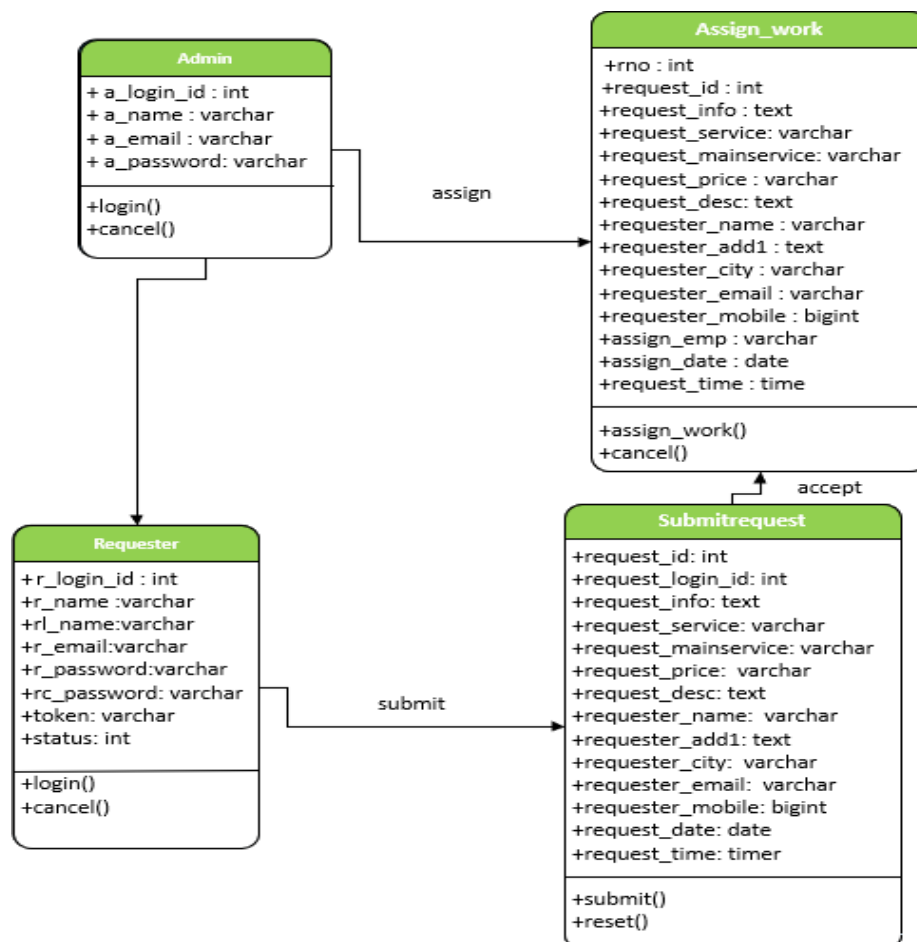

Figure 2.3: Class Diagram- The Crown bench services

4.5. Sequence Diagram:

A sequence diagram is a Unified Modelling Language (UML) is a kind of interaction diagram that shows how processes operate with one another and in what order. It is a construct of a message e-mail chart. A sequence diagram shows objects interactions arranged in time sequence. It depicts the objects and classes involved in the scenario and the sequence of messages exchanged between the objects needed to carry out the functionality of scenario. Sequence diagrams typically (but not always), are associated with use case realizations in the logical view of the system under development.

➤ **Sequence Diagrams captures:**

The interaction that takes place in collaboration that either realizes a use case or an operation (instance diagrams or generic diagrams)

High-level interactions between user of the system and the system, between the system and other systems, or between subsystems (sometimes known as system sequence diagrams)

➤ **Purpose of Sequence Diagram:**

- Model high-level interaction between active objects in a system
- Model the interaction between object instances within a collaboration that realizes a use case.
- Model the interaction between objects within a collaboration that realizes an operation
- Either model generic interactions (showing all possible paths through the interaction) or specific instances of an interaction (showing just one path through the interaction)

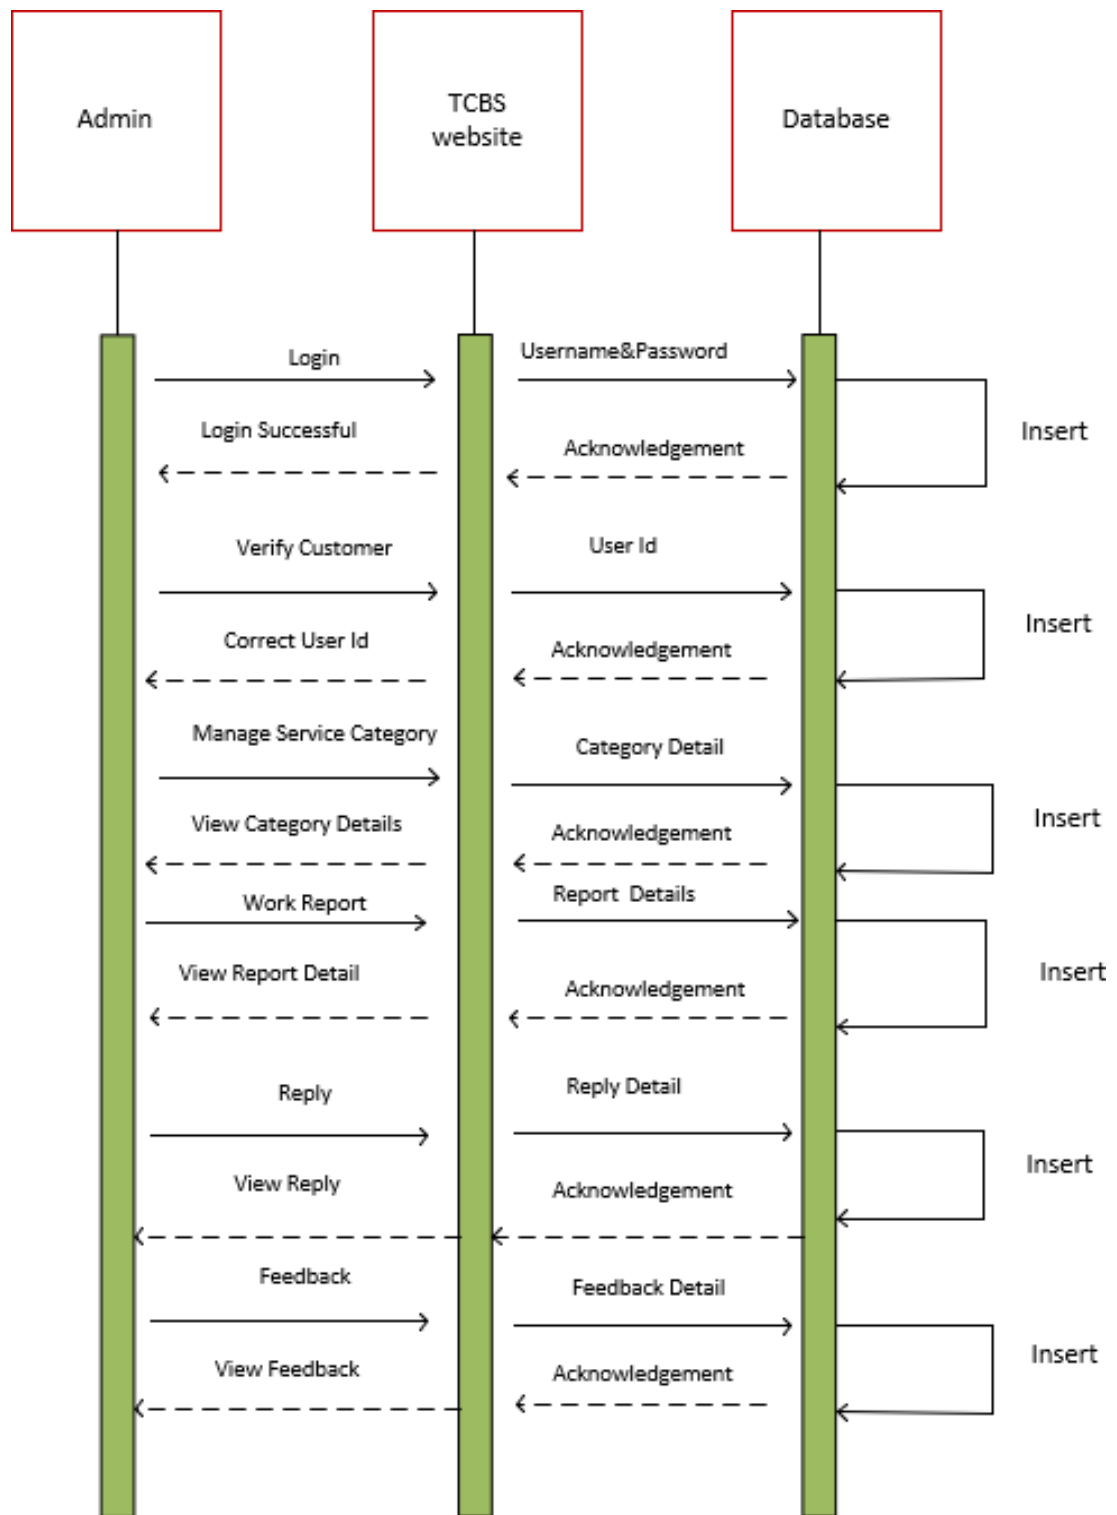

Figure 3.4: Admin Sequence Diagram- The Crown bench services

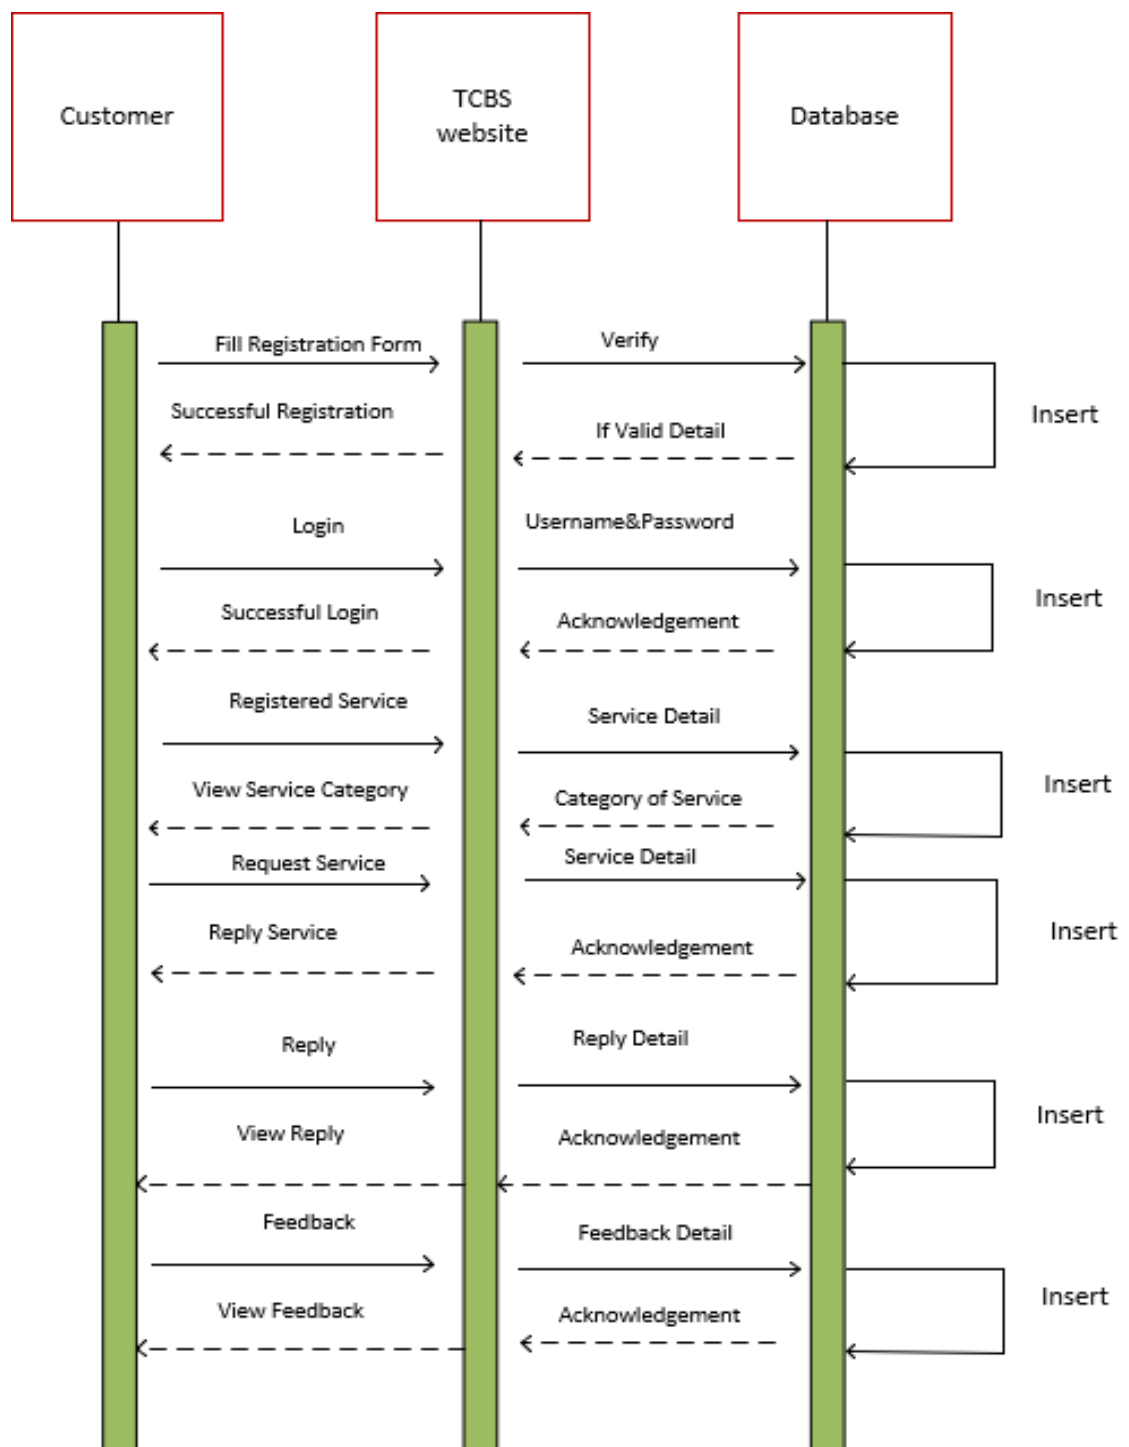

Figure 4.5: Consumer Sequence Diagram- The Crown bench services

4.6. Data Flow Diagram (DFD):

Data flow diagram is graphical representation of flow of data in an information system. It uses defined symbols like rectangles, circles and arrows, plus short text labels, to show data inputs, outputs, storage points and the routes between each destination. Data flowcharts can range from simple, even hand-drawn process overviews, to in-depth, multi-level DFDs that dig progressively deeper into how the data is handled.

4.6.1. DFD 0 Level:

The 0 Level DFD shows flow of data of application. DFD Level 0 is also called a Context Diagram. It's a basic overview of the whole system or process being analyzed or modeled.

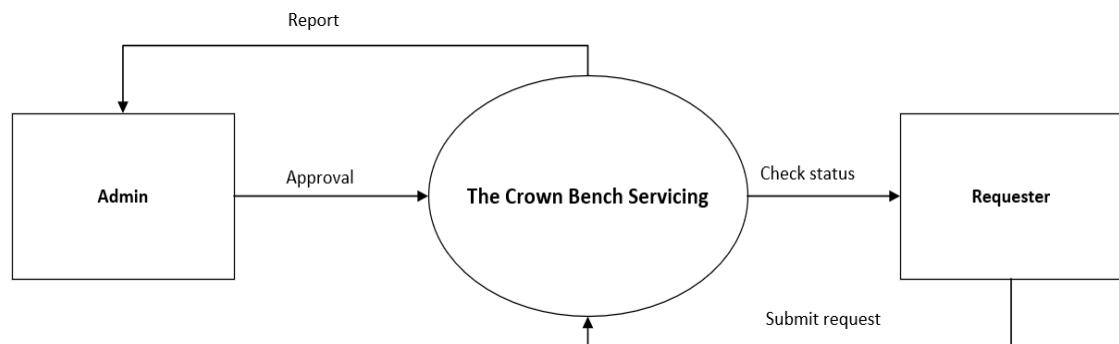

Figure 5.6: Data Flow Diagram- The Crown bench services

4.6.2. DFD 1 Level:

DFD Level 1 provides a more detailed breakout of pieces of the Context Level Diagram. This DFD describes main functions carried out by the system, as we break down the high-level process of the Context Diagram into its sub-processes.

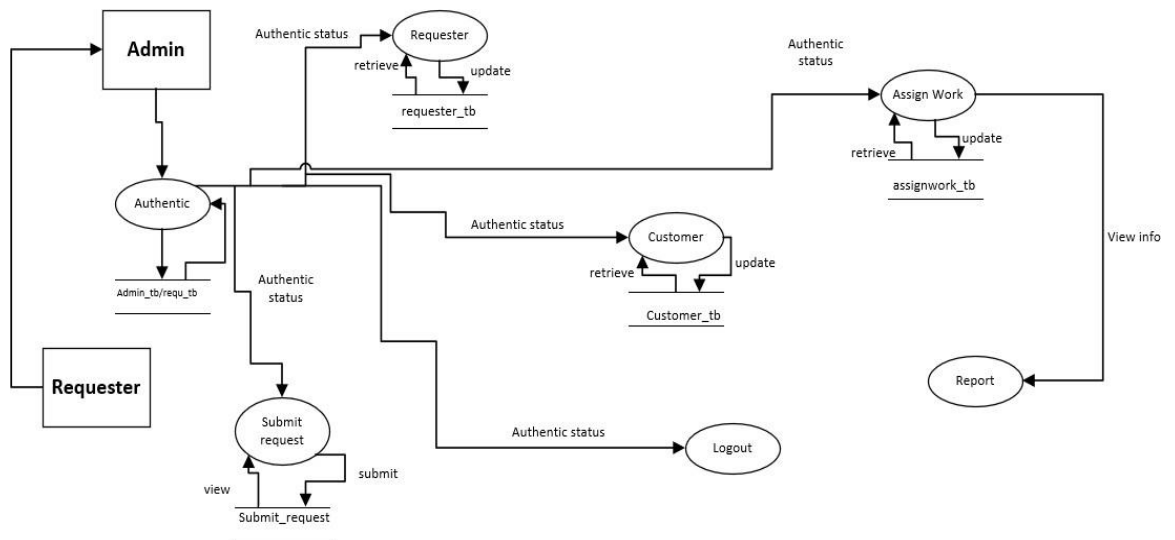

Figure 6.7: Data Flow Diagram 1- The Crown bench services

4.6.3. DFD 2 Level:

The DFD 2 Level describes flow of data in more detail. DFD Level 2 goes one step deeper into parts of Level 1. It may require more text to reach the necessary level of detail about the system's functioning.

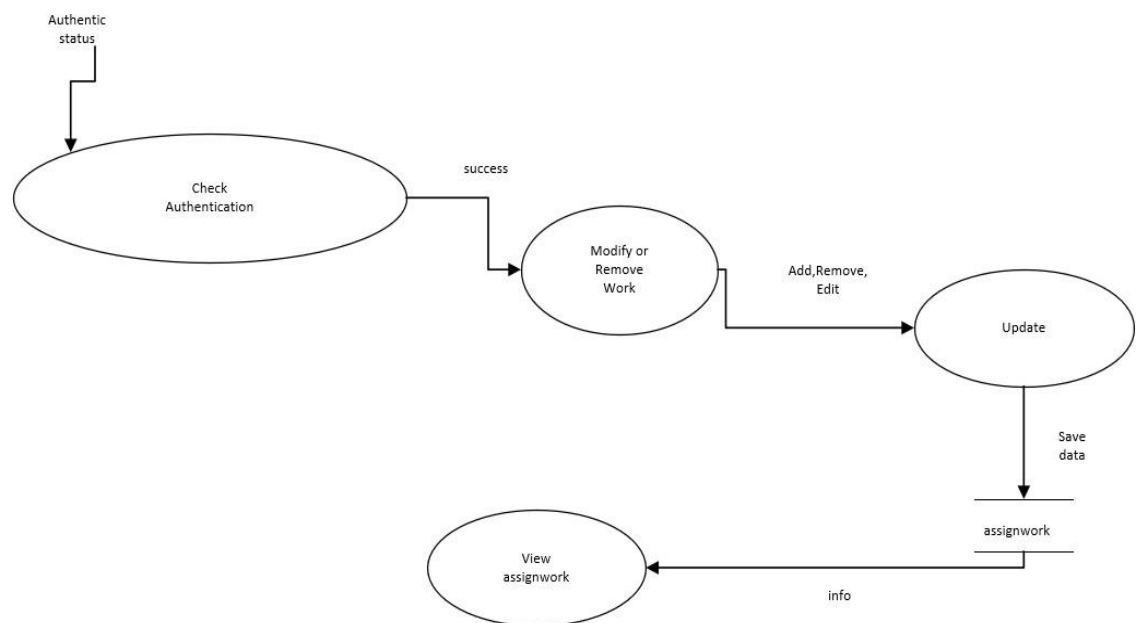

Figure 7.8: Data Flow Diagram 2- The Crown bench services

4.7. Activity Diagram:

Activity diagram is basically a flowchart to represent the flow from one activity to another activity. The activity can be described as an operation of the system. The control flow is drawn from one operation to another.

➤ **Activity diagram for admin:**

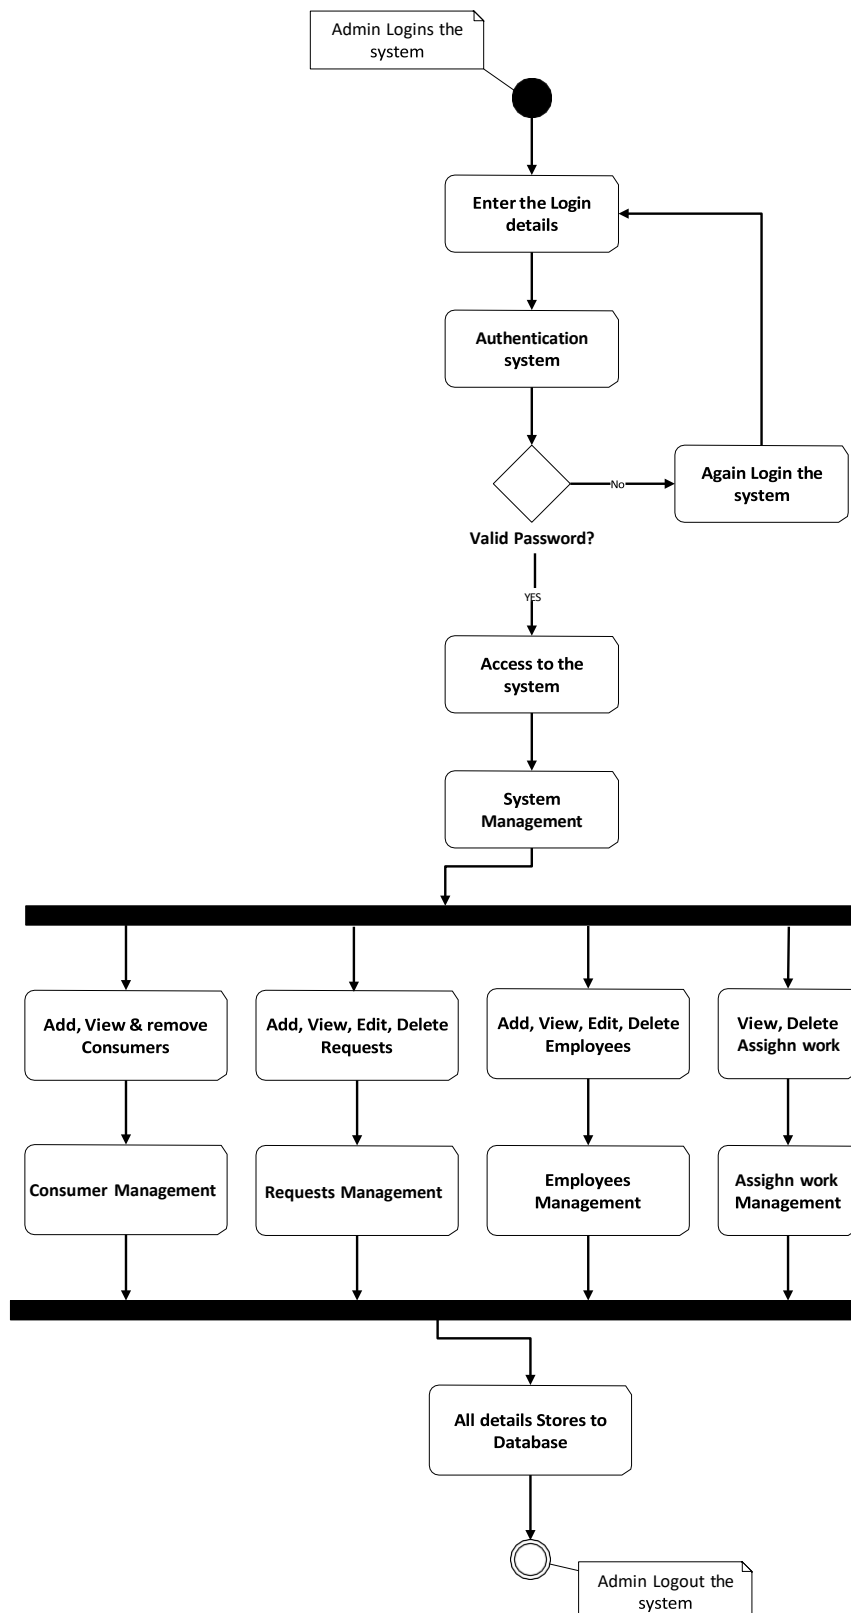

Figure 4.9: Activity Diagram for Admin- The Crown Bench Services

➤ Activity Diagram for user:

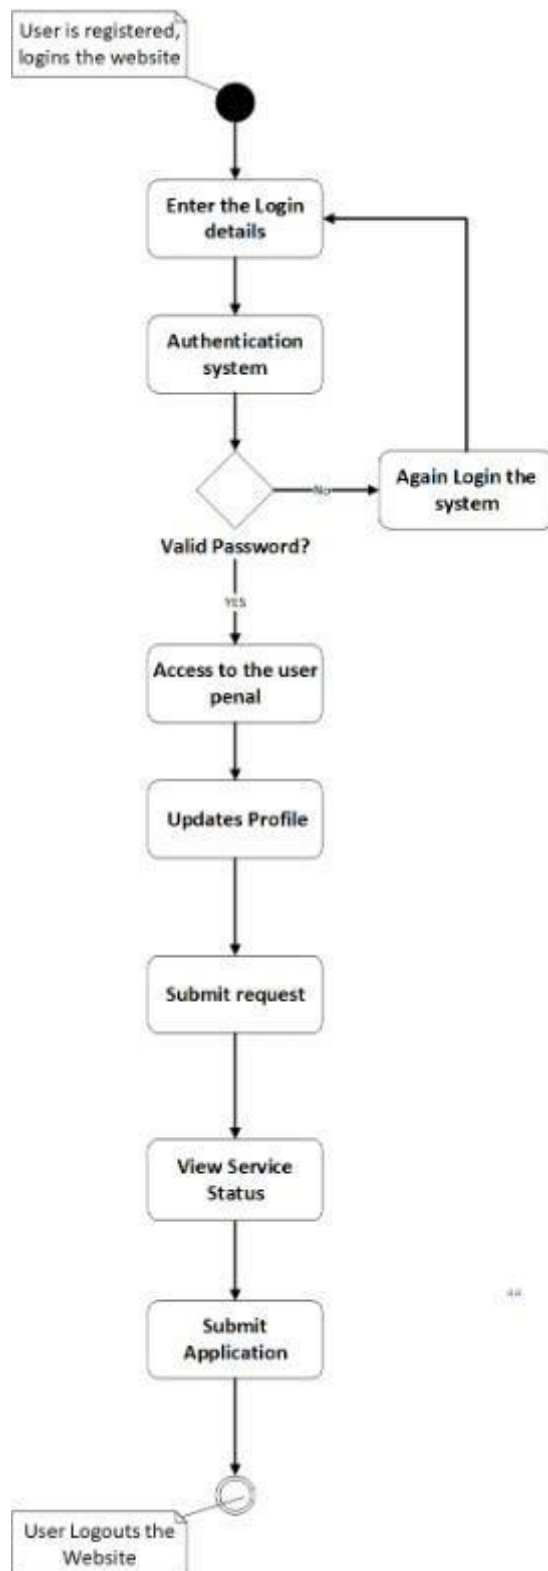

Figure 4.10: Activity Diagram for User- The Crown Bench Services

4.8. Process Logic:

Process logic is best represented through structured English, decision tables, decision trees or specified formulas or algorithms and is used to communicate engineering requirements and procedures to businesses involved in the creation of a process. High-quality, consistent data requires clear and complete process specifications.

A process specification reduces ambiguity, allowing an individual or organization to obtain a precise description of executed tasks and accomplishments and validate system design, including the data dictionary and data flow diagrams.

4.8.1. Login Panel for User:

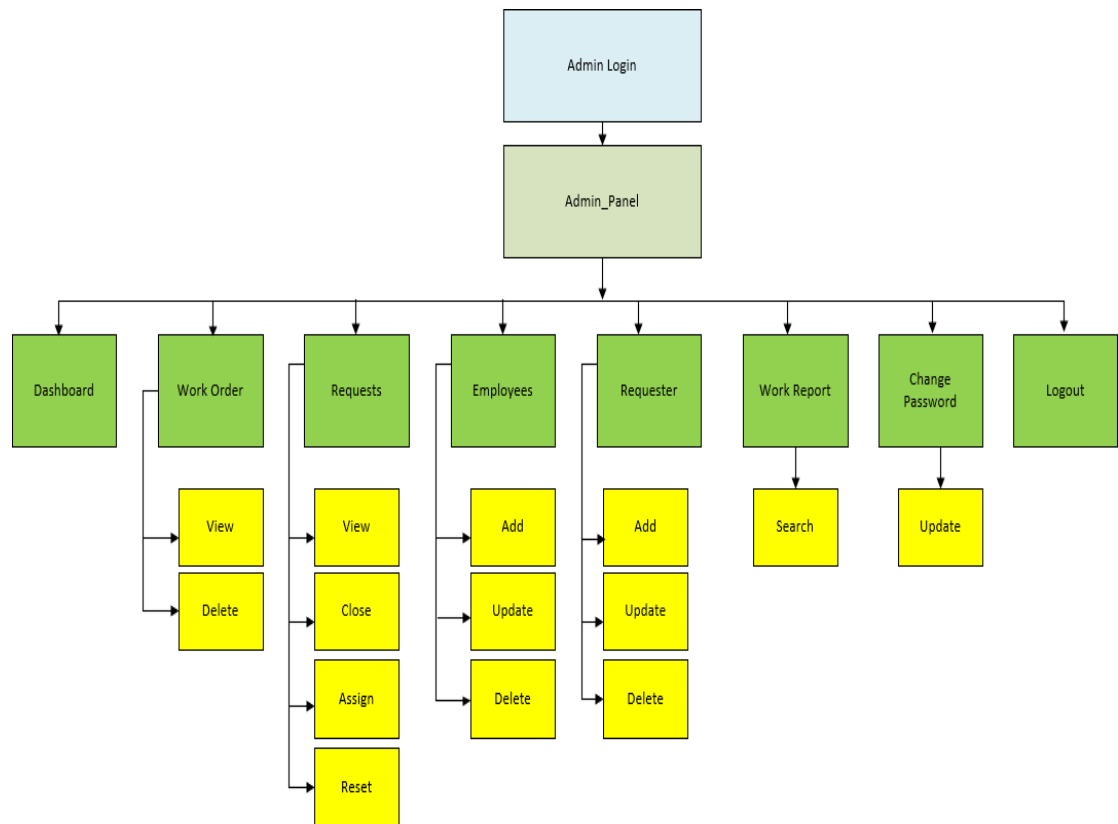

Figure 9.12: Admin Login Panel- The Crown bench services

Chapter No 5: Implementation

5.1. Implementation:

Our dedication to our clients goes well beyond the deployment of our system. We are committed to providing our client with a positive experience that starts with a successful implementation. Implementation is the stage in the project where the theoretical design is turned into a working system. The implementation phase constructs, installs and operates the new system. The most stage is achieving a new successful system is that it will work efficiently and effectively. Security and integrity of database are very important for any software system because databases are the backbone of the system. Security needs to be implanted at every level of the system so that only authorized user can access the system for update and other significance process.

5.2. Database Architecture

Database architecture uses programming languages to design a particular type of software for businesses or organizations. Database architecture focuses on the design, development, implementation and maintenance of computer programs that store and organize information for businesses, agencies and institutions. A database architect develops and implements software to meet the needs of users.

The design of a DBMS depends on its architecture. It can be centralized or decentralized or hierarchical. The architecture of a DBMS can be seen as either single tier or multi-tier. The tiers are classified as follows:

- **1-tier architecture**
- **2-tier architecture**
- **3-tier architecture**

1-Tire Database Architecture

1 Tier Architecture in DBMS is the simplest architecture of Database in which the client, server, and Database all exist in the same device. This is when the database is directly available to the user for using it to store data. Usually such a system is used for local application development, where programmers connect directly with the database for quick response.

Figure (5.1): 1-tier Database Architecture

2-Tire Database Architecture

A two-tier architecture is a database architecture were

1. Presentation layer runs on a client
2. Data is stored on a Server.

2-tier DBMS architecture includes an application layer between the client and the server, which is responsible to communicate the client's request to the database management system and then send the response from the DBMS to the user.

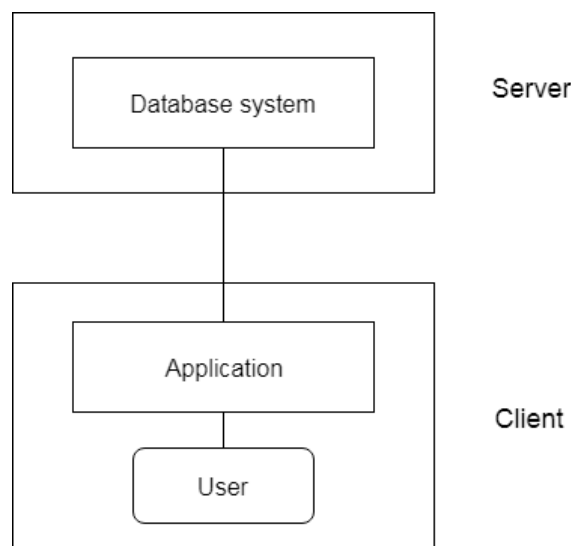

Figure (5.2): 2-tier Database Architecture

3-Tire Database Architecture

3-tier architecture has following layers.

1. Presentation layer
2. Application layer
3. Database Server

The 3-tier DBMS architecture contains an application layer between the user and the DBMS, which is responsible for communicating the user's request to the DBMS system and send the response from the DBMS to the user.

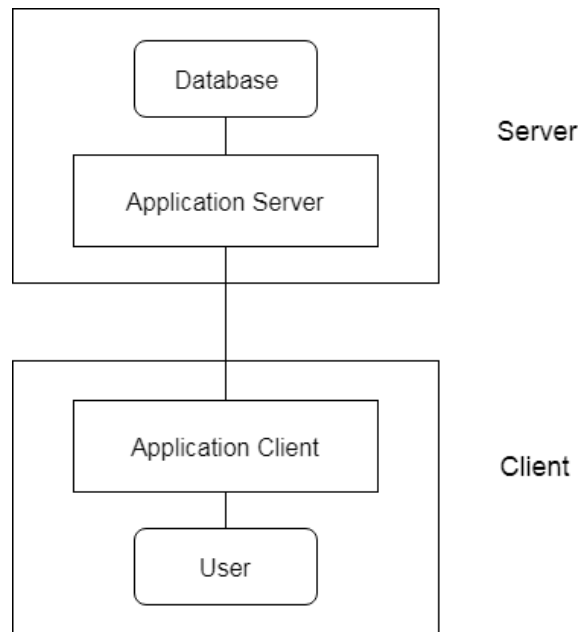

Figure (5.3)10: 3-tier Database Architecture

Chapter No 6: Testing (Software Quality Attributes)

6.1. System Testing:

System testing is testing conducted on a complete integrated system to evaluate the system's compliance with its specified requirements.

System testing takes, as its input, all of the integrated components that have passed integration testing. The purpose of integration testing is to detect any inconsistencies between the units that are integrated together (called assemblages). System testing seeks to detect defects both within the "inter-assemblages" and also within the system as a whole. [citation needed] The actual result is the behavior produced or observed when a component or system is tested.

System testing is performed on the entire system in the context of either functional requirement specifications (FRS) or system requirement specification (SRS), or both. System testing tests not only the design, but also the behavior and even the believed expectations of the customer. It is also intended to test up to and beyond the bounds defined in the software or hardware requirements specification(s).

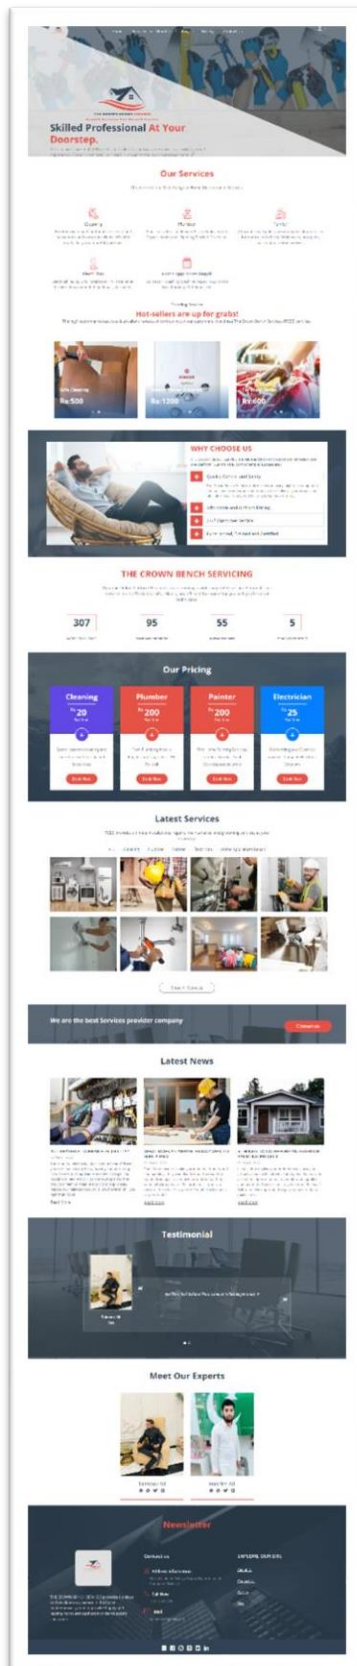

Repeat System testing is testing conducted on a complete integrated system to evaluate the system's compliance with its specified requirements.

System testing takes, as its input, all of the integrated components that have passed integration testing. The purpose of integration testing is to detect any inconsistencies between the units that are integrated together (called assemblages). System testing seeks to detect defects both within the "inter-assemblages" and also within the system as a whole. [citation needed] The actual result is the behavior produced or observed when a component or system is tested.

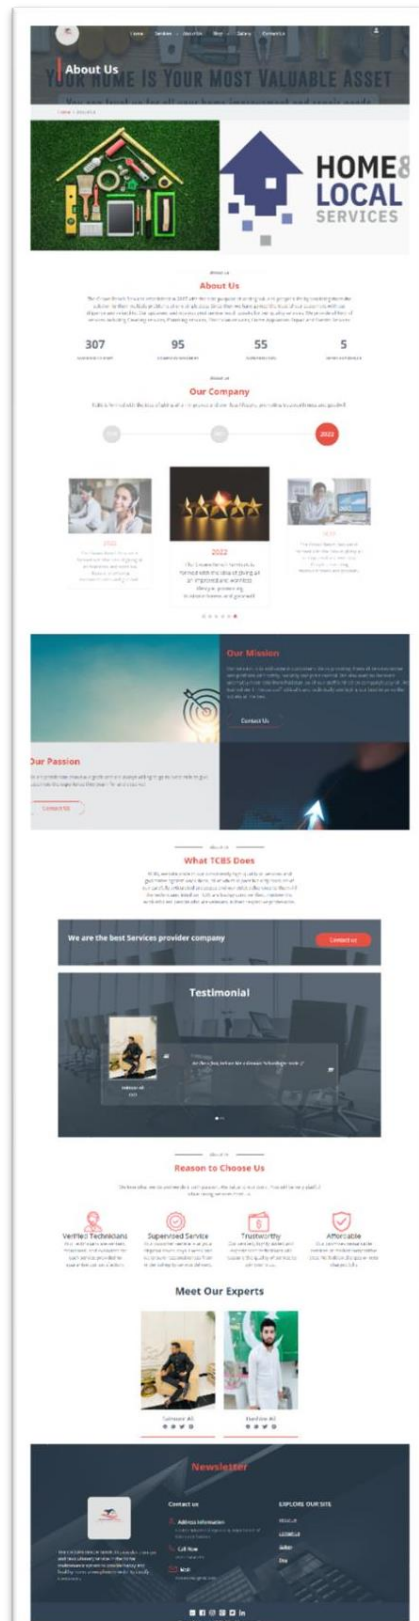

System testing is performed on the entire system in the context of either functional requirement specifications (FRS) or system requirement specification (SRS), or both. System testing tests not only the design, but also the behavior and even the believed expectations of the customer. It is also intended to test up to and beyond the bounds defined in the software or hardware requirements specification(s).

➤ **Admin requested Work list and assign work form:**

The screenshot displays the TCBS Admin interface. On the left is a sidebar with a 'WORK ORDER' section containing links for 'Requests', 'Employees', 'Requester', 'Work Report', 'Change Password', and 'Logout'. The main content area is divided into two panels. The left panel, titled 'Request Info : info', shows a list of requests with details like 'Request ID', 'Request Info', and 'Request Date'. Each entry has 'View' and 'Close' buttons. The right panel, titled 'Assign Work Order Request Of TCBS', is a form for assigning work. It includes fields for 'Request ID', 'Request Info', 'Request Service', 'Request MainService', 'Request Price', 'Description', 'Name', 'Address Line 1', 'City', 'Email', 'Mobile', 'Date', 'Time', and 'Employee'. There are also 'Submit' and 'Reset' buttons at the bottom.

➤ **User Profile Page:**

The screenshot shows the TCBS User Profile Page. The sidebar on the left has a 'Profile' section with links for 'Submit Request', 'Service Status', 'Change Password', and 'Logout'. The main content area features a 'Welcome' message followed by a form for user details. The form includes fields for 'Email', 'First Name', and 'Last Name'. There are 'Submit' and 'Reset' buttons at the bottom.

➤ **User Submit Request Page:**

The screenshot displays the TCBS User Submit Request Page. The sidebar on the left has a 'Profile' section with links for 'Submit Request', 'Service Status', 'Change Password', and 'Logout'. The main content area is a form for submitting a request. It includes fields for 'Request Info', 'Request Info', 'All Services', 'Select a Service', 'Service Price', 'Description', 'Name', 'Address', 'City', 'Email', 'Mobile', 'Date', and 'Time'. There are 'Submit' and 'Reset' buttons at the bottom.

➤ **User Service Status Page:**

The screenshot shows a web application interface for 'ICBS'. On the left is a sidebar with navigation links: Profile, Submit Request, **Service Status** (highlighted in red), Change Password, and Logout. The main content area is titled 'Assigned Work Details of The Crown Bench Services'. It contains a table with the following data:

Request ID	108
Request Info	info
Request Description	www
Name	First Name Last Name
Address Line 1	www
City	www
Email	user1@gmail.com
Mobile	2222222222
Assigned Date	2022-06-28
Time	18:57:00
Technician Name	mechanic

Technician Sign	

6.2. Test Case Specification

➤ **Test Case for Sign up**

Test Case: 1	Sign In
Purpose	Verify that system grants access to an authenticated user.
Pre-Condition	User must be registered
Test Data	Sign in = {valid=user signed in; invalid =user not signed in}
Test steps	1. Enter username and password in login form. 2. Click login button. 3. System will validate the entered username and password, and logs the actor into the system. 4. Home page will be shown.

Test Results	Normal Flow	Expected Flow	Status
	User request access to system services.	System verifies user's login credentials and grants him/her access as per access level	Fail

Table (6.1): Test Case for Signup

➤ **Test Case for Add Employees**

Test Case: 2	Add Employees		
Purpose	Verify that system adds new Employees.		
Pre-Condition	User must be logged in as Administrator		
Test Data	Add Employees = {valid=Employees add; invalid =Employees not added}		
Test steps	1. Click on the Employees tab. 2. Click in Add Button. 3. Fill add New Employees form. 4. Click on Submit button. 5. Successful Submit new Employee is added to the system.		
Test Results	Normal Flow	Expected Flow	Status
	Fill add Employees form and request the system to add Employee.	New Employees is added and confirmation message is displayed	Fail

Table (6.2): Test Case for Add Employees

➤ **Test Case for Assign Work Order of Request**

Test Case: 3	Assign Work Order of Request
Purpose	Verify that system the existing Employee.
Pre-Condition	User must be logged in as Administrator
Test Data	Assign Work = {valid=Assign; invalid =Assign not saved}

Test steps	1. Click on the Request tab. 2. View & Delete the Request. 3. Click Assign and Reset Button. 4. Display Message Work Assign Successfully.								
Test Results	<table><tr><th>Normal Flow</th><th>Expected Flow</th><th>Status</th></tr><tr><td>Administrator makes the changes and requests the system to save changes.</td><td>Assign Click Button the confirmation messages is displayed.</td><td>Fail</td></tr></table>			Normal Flow	Expected Flow	Status	Administrator makes the changes and requests the system to save changes.	Assign Click Button the confirmation messages is displayed.	Fail
Normal Flow	Expected Flow	Status							
Administrator makes the changes and requests the system to save changes.	Assign Click Button the confirmation messages is displayed.	Fail							

Table (6.3): Test Case for Assign Work Order of Request

➤ **Test Case for Assign Work Order**

Test Case: 4	Work Order								
Purpose	To see all work order assign of user’s request.								
Pre-Condition	User must be logged in as Administrator								
Test steps	1. Click on the Work order tab. 2. Click on the view action button. 3. Admin should Delete work order Assign button.								
Test Results	<table><tr><th>Normal Flow</th><th>Expected Flow</th><th>Status</th></tr><tr><td>Admin Click on the view button to display assign an Employee of User request.</td><td>Admin Click on the Delete button to display assign an Employee of User request.</td><td>Fail</td></tr></table>			Normal Flow	Expected Flow	Status	Admin Click on the view button to display assign an Employee of User request.	Admin Click on the Delete button to display assign an Employee of User request.	Fail
Normal Flow	Expected Flow	Status							
Admin Click on the view button to display assign an Employee of User request.	Admin Click on the Delete button to display assign an Employee of User request.	Fail							

Table (6.4): Test Case for Assign Work Order

➤ **Test Case for Assign Work Report**

Test Case: 5	Work Report		
Purpose	To see all work report of Employees to assign user's request.		
Pre-Condition	User must be logged in as Administrator		

Test Data	Work Report = {valid=click search button; invalid =not select date in search bar}								
Test steps	1. Click on the request tab. 2. Click on Search bar and select date. 3. Click on the Search button. 4. Display all work report of Employees to assign user’s request.								
Test Results	<table><tr><td>Normal Flow</td><td>Expected Flow</td><td>Status</td></tr><tr><td>Admin To see all work report of Employees to assign user’s request.</td><td>Administrator Should print All work report of Employees to assign user’s request.</td><td>Fail</td></tr></table>			Normal Flow	Expected Flow	Status	Admin To see all work report of Employees to assign user’s request.	Administrator Should print All work report of Employees to assign user’s request.	Fail
Normal Flow	Expected Flow	Status							
Admin To see all work report of Employees to assign user’s request.	Administrator Should print All work report of Employees to assign user’s request.	Fail							

Table (6.5): Test Case for Assign Work Report

6.3. Black Box Test Cases

Black box testing involves testing a system with no prior knowledge of its internal workings. A tester provides an input, and observes the output generated by the system under test.

Black Box Testing is a software testing method in which the functionalities of software applications are tested without having knowledge of internal code structure, implementation details and internal paths. Black Box Testing mainly focuses on input and output of software applications, and it is entirely based on software requirements and specifications. It is also known as Behavioral Testing.

6.3.1. BVA or Boundary Value Analysis

Boundary Value Analysis (BVA) is a Black-Box testing technique used to check the errors at the boundaries of an input domain.

The name comes from the Boundary, which means the limits of an area. So, BVA mainly focuses on testing both valid and invalid input parameters for a given range of a software component.

The main advantage of Boundary Value Analysis is that the testing time is less as the tester will analyze the data only at the boundaries. Since this technique cannot concentrate on the errors that exist in the center of the input domain, it is always advisable to use BVA with a combination of Equivalence Class Partitioning.

6.3.2. Equivalence Class Partitioning

Equivalence Partitioning Method is also known as Equivalence class partitioning (ECP). It is a software testing technique or black-box testing that divides input domain into classes of data, and with the help of these classes of data, test cases can be derived. An ideal test case identifies class of error that might require many arbitrary test cases to be executed before general error is observed.

In equivalence partitioning, equivalence classes are evaluated for given input conditions. Whenever any input is given, then type of input condition is checked, then for this input conditions, Equivalence class represents or describes set of valid or invalid states.

➤ Guidelines for Equivalence Partitioning:

- If the range condition is given as an input, then one valid and two invalid equivalence classes are defined.
- If a specific value is given as input, then one valid and two invalid equivalence classes are defined.
- If a member of set is given as an input, then one valid and one invalid equivalence class is defined.
- If Boolean no. is given as an input condition, then one valid and one invalid equivalence class is defined.

6.3.3. State Transition Testing

State transition technique is a dynamic testing technique, which is used when the system is defined in terms of a finite number of states and the transitions between the states are governed by the rules of the system.

Or in other words, this technique is used when features of a system are represented as states which transform into one another. The transformations are determined by the rules of the software. The pictorial representation can be shown as:

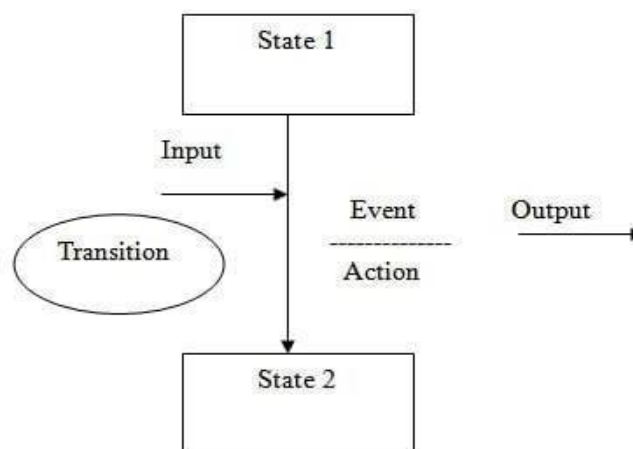

Figure (6.1): State Transition Testing

6.3.4. Decision Table Testing

Decision table testing is a software testing technique used to test system behavior for different input combinations. This is a systematic approach where the different input combinations and their corresponding system behavior (Output) are captured in a tabular form. That is why it is also called as a Cause-Effect table where Cause and effects are captured for better test coverage.

6.3.5. Graph Base Testing

Graph-based testing – we identify inputs which will exercise paths through a graph representing the software in some way. The graph could represent. Control flow through a program. Data flow between variables. An activity diagram, showing the workflow when a user interacts.

Kind of graphs base testing

Some most common types include line graphs, bar graphs and histograms, pie charts and Cartesian graphs

6.4. White Box Testing:

White box testing involves the testing of the software code for the following: Internal security holes. Broken or poorly structured paths in the coding processes. The flow of specific inputs through the code

➤ Benefits of White Box testing

It allows a finding of hidden errors, to find internal errors because it checks and works by internal functionality. It helps to find issues and optimize code to adopt different techniques of White Box Testing to test a developed application or website.

6.4.1. Statement Coverage

Statement coverage is one of the widely used software testing. It comes under white box testing. Statement coverage technique is used to design white box test cases. This technique involves execution of all statements of the source code at least once. It is used to calculate the total number of executed statements in the source code out of total statements present in the source code.

Statement coverage derives scenario of test cases under the white box testing process which is based upon the structure of the code.

$$\text{Statement coverage} = \frac{\text{Number of executed statements}}{\text{Total number of statements}} * 100$$

6.4.2. Branch Coverage

To calculate Branch Coverage, one must find out the minimum number of paths which will ensure that all the edges are covered. In this case there is no single path which will

ensure coverage of all the edges at once. The aim is to cover all possible true/false decisions.

6.4.3. Path Coverage

Path coverage testing is a specific kind of methodical, sequential testing in which each individual line of code is assessed. As a type of software testing, path coverage testing is in the category of technical test methods, rather than being part of an overarching strategy or "philosophy" of code.

➤ Difference between branch coverage and path coverage

Path coverage counts the number of full paths from input to output through a program that get executed, whereas branch coverage counts the number of branches that were tested at any point in time.

Chapter No 7: Tools and Technologies

7.1. Programming Languages

The complete The Crown Bench Services system is divided into parts which are as follows

- Front End
- Back End
- Framework
- Database and DBM Tool
- Hosting Environment

7.1.1. Front End

Front end includes languages which are as follows

- PHP
 - HTML
 - CSS
 - JavaScript
 - Bootstrap
 - Ajax
- **PHP (Hypertext Preprocessor)**

PHP is a server-side scripting language that is designed to develop the website, but we can also use it as a general-purpose programming language. It is originally use for personal home page that is why it is called Hypertext Preprocessor. PHP commands can directly fix into HTML source document instead of calling an external file that is used to process the data.

It can also use to include the command line interface abilities. It is free software that is release under the PHP License. It can be organized on most of the web servers, and it can also use as a standalone shell that almost each operating system and platform used it as a free of charge.

➤ **HTML (Hyper Text Markup Language)**

HTML is the language that is used to create web pages and all kind of information that is displayed in a web browser. HTML can be written in the form of HTML elements that consist of tags that are enclosed in angle brackets. For example, <html>, in the webpage content. HTML tags that are used mostly are par tags for example <h1> and </h1>, but some tags are empty elements and unpaired, for example <image>.

The first tag that we are used in a pair is called start tag and the second tag is called end tag, (they are also called opening and closing tags). Between these tags a web designer can add text, another tags, comments and all type of contents that is consist of text-based content. The main purpose of browser is to read HTML documents create them into observable and clear web pages.

The web browser cannot display the html tags but use the tags to display the content of web page. HTML elements consist of building blocks of all websites. Html allows

images and objects and used it to display them in interactive form. It provides a meaning to create structured documents for text such as headings, comments, links, quotes and all other items. It can use scripts written in the language like JavaScript which affect the performance and behavior of HTML web pages.

➤ **CSS (Cascading Style Sheet)**

CSS is a style sheet language we can use for describing the look and make the format of a document that is written in a markup language. It is mostly used to give styling to the web pages and interfaces that is written in HTML and XHTML.

It is a type of language that will apply on any kind of document, including plain XML, SVG and XUL. Almost all the web pages use CSS style sheets to describe the presentation. CSS is designed of the separation of the documents from the presentation, elements, layout, colors and fonts. The separation is improved content accessibility, flexibility and manages all the specifications of presentation characteristics and reduces the complexity and repetition in the structural content.

CSS is also allowed that the same makeup pages is displayed in the different styles for different methods such as on screen, in print, by voice, and on tactile devices. It is also allowed to the web pages difference that depend on the screen size or device on which it is being viewed. Therefore, if the author/reader is not linking the document with a specific style sheet with the default style of the web browser is applied. CSS is specified a preference to check which rule or style will if there is more than one rule matches against a particular element. That is why it is called cascade, preference or weights are calculated and assigned to rules.

➤ **JS (JavaScript)**

JavaScript is a computer language that is mostly used as a part of web browser. Its implementations are allowed to the user that client-side scripts to make interaction with the user that control the user and replace that document that is displayed on the screen. It can also use for server-side programming, developing games and used to develop the desktop and mobile applications. JavaScript is a scripting language that is used for dynamic typing, and it has first class functions. Its Syntax is related with C. JavaScript has copy many names and conventions from Java, these two languages are different languages. Both languages are unrelated languages, and they have different semantics. The design principles and rules of JavaScript are taken from the self, and it has taken from scheme programming language. JavaScript is a multi-paradigm language that supports object oriented and functional programming styles.

➤ **Bootstrap**

Bootstrap is a free and open-source CSS framework directed at responsive, mobile-first front-end web development. It contains HTML, CSS and (optionally) JavaScript-based design templates for typography, forms, buttons, navigation, and other interface components.

➤ **AJAX**

AJAX stands for **A**synchronous **J**avaScript and **X**ML. AJAX is a new technique for creating better, faster, and more interactive web applications with the help of XML, HTML, CSS, and Java Script. Ajax uses XHTML for content, CSS for presentation, along with Document Object Model and JavaScript for dynamic content display.

With AJAX, when you hit submit, JavaScript will make a request to the server, interpret the results, and update the current screen. In the purest sense, the user would never know that anything was even transmitted to the server.

AJAX is a web browser technology independent of web server software. A user can continue to use the application while the client program requests information from the server in the background.

7.1.2. Database and DBM Tool:

➤ **MYSQL**

The Backend is developed by using MySQL that is used to design the database.

MYSQL Officially MySQL is called “My-S-Q-L” but it is also called “My Sequel”. In the July 2013 it became the World’s second most widely used open-source relational database management system. Its name is keeping founder of the database the Michael (Widen us) daughter, me. The SQL stands for Structured Query Language. The development of MYSQL is made its source code available under the terms of GNU General Public License with under the variety of proprietary agreements. MYSQL is a famous and popular choice for database to use the web applications and it is a central component of the widely used open-source web application software stack. (RDBMS) that works on many platforms. It provides multi-user access to support many storage engines and is backed by Oracle. So, you can buy a commercial license version from Oracle to get premium support services. The software very easily gets downloaded and uses an event scheduler to schedule the tasks automatically. MySQL has plug-in libraries to embed the database into any application. MySQL is written in C and C++.

➤ **PhpMyAdmin**

PhpMyAdmin is an open-source software tool introduced on **September 9, 1998**, which is written in PHP. Basically, it is a third-party tool to manage the tables and data inside the database. PhpMyAdmin supports various type of operations on **MariaDB** and **MySQL**. The main purpose of PhpMyAdmin is to handle the administration of MySQL over the web. PhpMyAdmin can be exported into various formats such as XML, CSV, PDF, ISO/IEC 26300 - Open Document Text and Spreadsheet. PhpMyAdmin is a **GUI-based application** which is used to manage MySQL database.

7.1.3. Hosting Environment

➤ XAMPP

XAMPP is a cross-platform web server that is free and open-source. XAMPP is a short form for Cross-Platform, Apache, MySQL, PHP, and Perl. XAMPP is a popular cross-platform web server that allows programmers to write and test their code on a local web server. It was created by Apache Friends, and the public can revise or modify its native source code. It includes MariaDB, Apache HTTP Server, and interpreters for PHP and Perl, among other computer languages. Because of XAMPP's simplicity of deployment, a developer can quickly and easily install a WAMP or LAMP stack on an operating system, with the added benefit that common add-in apps like Word Press and Joomla can also be loaded.

7.2. Operating Environment

In computer software, an operating environment is the environment in which users run application software. The operating environment of the system contain two things which are as follows.

- Software requirements
- Hardware Requirements
- **Software requirements**

This proposed system will be used in window platform in the version of Windows 8.1. MYSQL will be used for the database to hold the patients, doctors and other Staff details.

➤ **Hardware Requirements**

- **Processor** : Pentium, AMD or Higher Version.
- **RAM** :256 MB, 2GB recommended
- **Hard disk** :10GB or More

Appendix A

➤ **User documentation**

As a part of the system itself a user documentation is provided to the **Admin** and the **User/Customer** which gives an overview of the system. It will provide full description about the system. The Admin and User/Customer will get all opportunities easily to use the system without any problem.

MySQL	Structure query language
DB	Database
CRUD	Create, Read, Update, Delete
Consumer	Someone who interact with the system
PHP	Hypertext Pre-processor

Appendix B
